## QUINOLINE DERIVATIVES INHIBITING THE EFFECT OF GROWTH FACTORS SUCH AS VEGF

The present invention relates to quinoline derivatives, processes for their preparation, pharmaceutical compositions containing them as active ingredient, methods for the treatment of disease states associated with angiogenesis and/or increased vascular permeability and to their use in the manufacture of medicaments for use in the production of antiangiogenic and/or vascular permeability reducing effects in warm-blooded animals such as humans.

Normal angiogenesis plays an important role in a variety of processes including embryonic development, wound healing and several components of female reproductive function. Undesirable or pathological angiogenesis has been associated with disease states including diabetic retinopathy, psoriasis, cancer, rheumatoid arthritis, atheroma, Kaposi's sarcoma and haemangioma (Fan et al, 1995, Trends Pharmacol. Sci. 16: 57-66; Folkman, 1995, Nature Medicine 1: 27-31). Alteration of vascular permeability is thought to play a role in both normal and pathological physiological processes (Cullinan-Bove et al, 1993, Endocrinology 133: 829-837; Senger et al, 1993, Cancer and Metastasis Reviews, 12: 303-324). Several polypeptides with in vitro endothelial cell growth promoting activity have been identified including, acidic and basic fibroblast growth factors (aFGF & bFGF) and vascular endothelial growth factor (VEGF). By virtue of the restricted expression of its receptors, the growth factor activity of VEGF, in contrast to that of the FGFs, is relatively specific towards endothelial cells. Recent evidence indicates that VEGF is an important stimulator of both normal and pathological angiogenesis (Jakeman et al, 1993, Endocrinology, 133: 848-859; Kolch et al, 1995, Breast Cancer Research and Treatment, 36:139-155) and vascular permeability (Connolly et al, 1989, J. Biol. Chem. 264: 20017-20024). Antagonism of VEGF action by sequestration of VEGF with antibody can result in inhibition of tumour growth (Kim et al, 1993, Nature 362: 841-844).

Receptor tyrosine kinases (RTKs) are important in the transmission of biochemical signals across the plasma membrane of cells. These transmembrane molecules characteristically consist of an extracellular ligand-binding domain connected through a segment in the plasma membrane to an intracellular tyrosine kinase domain. Binding of ligand to the receptor results in stimulation of the receptor-associated tyrosine kinase activity which leads to phosphorylation of tyrosine residues on both the receptor and other intracellular molecules. These changes in tyrosine phosphorylation initiate a signalling cascade leading to a

variety of cellular responses. To date, at least nineteen distinct RTK subfamilies, defined by amino acid sequence homology, have been identified. One of these subfamilies is presently comprised by the *fms*-like tyrosine kinase receptor, Flt or Flt1, the kinase insert domain-containing receptor, KDR (also referred to as Flk-1), and another *fms*-like tyrosine kinase receptor, Flt4. Two of these related RTKs, Flt and KDR, have been shown to bind VEGF with high affinity (De Vries et al, 1992, Science 255: 989-991; Terman et al, 1992, Biochem. Biophys. Res. Comm. 1992, 187: 1579-1586). Binding of VEGF to these receptors expressed in heterologous cells has been associated with changes in the tyrosine phosphorylation status of cellular proteins and calcium fluxes.

European Patent Publication No. 0326330 discloses certain quinoline, quinazoline and cinnoline plant fungicides. Certain of these plant fungicides are also stated to possess insecticidal and miticidal activity. There is however no disclosure or any suggestion that any of the compounds disclosed may be used for any purpose in animals such as humans. In particular, the European Patent Publication contains no teaching whatsoever concerning angiogenesis and/or increased vascular permeability mediated by growth factors such as VEGF.

The present invention is based on the surprising discovery that certain quinolines inhibit the effects of VEGF, a property of value in the treatment of disease states associated with angiogenesis and/or increased vascular permeability such as cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, arterial restenosis, autoimmune diseases, acute inflammation and ocular diseases with retinal vessel proliferation. Compounds of the present invention possess good activity against VEGF receptor tyrosine kinase whilst possessing some activity against epidermal growth factor (EGF) receptor tyrosine kinase. Furthermore, compounds of the present invention, possess substantially higher potency against VEGF receptor tyrosine kinase than against EGF receptor tyrosine kinase or FGF R1 receptor tyrosine kinase. Thus compounds of the invention which have been tested possess activity against VEGF receptor tyrosine kinase such that they may be used in an amount sufficient to inhibit VEGF receptor tyrosine kinase whilst demonstrating no significant activity against EGF receptor tyrosine kinase or FGF R1 receptor tyrosine kinase.

According to one aspect of the present invention there is provided the use of compounds of the formula I:

For the avoidance of doubt it is to be understood that where in this specification a group is described as 'defined hereinbefore' this encompasses the first occurring and broadest definition as well as each and all of the preferred definitions for that group. For example, for compounds of formula I, n is defined as an integer from 0 to 5 but n is preferably an integer  
20 from 1 to 3, more preferably 2 or 3. Thus references in the specification to n as being "defined hereinbefore" are to be understood as references to not only the broadest prior definition of n, but also to incorporate the stated preferences for the definition of n.

In this specification unless stated otherwise the term "alkyl" includes both straight and branched chain alkyl groups but references to individual alkyl groups such as "propyl" are  
25 specific for the straight chain version only. An analogous convention applies to other generic terms. Unless otherwise stated the term "alkyl" advantageously refers to chains with 1-6 carbon atoms, preferably 1-4 carbon atoms. The term "alkoxy" as used herein, unless stated otherwise includes "alkyl"-O- groups in which "alkyl" is as hereinbefore defined. The term "aryl" as used herein unless stated otherwise includes reference to a C<sub>6-10</sub> aryl group which may, if  
30 desired, carry one or more substituents selected from halogeno, alkyl, alkoxy, nitro, trifluoromethyl and cyano, (wherein alkyl and alkoxy are as hereinbefore defined). The term "aryloxy" as used herein unless otherwise stated includes "aryl"-O-groups in which "aryl" is as

hereinbefore defined. The term "sulphonyloxy" as used herein refers to alkylsulphonyloxy and arylsulphonyloxy groups in which "alkyl" and "aryl" are as hereinbefore defined. The term "alkanoyl" as used herein unless otherwise stated includes alkylC=O groups in which "alkyl" is as defined hereinbefore, for example ethanoyl refers to  $\text{CH}_3\text{C}=\text{O}$ . In this specification unless  
5 stated otherwise the term "alkenyl" includes both straight and branched chain alkenyl groups but references to individual alkenyl groups such as 2-butenyl are specific for the straight chain version only. Unless otherwise stated the term "alkenyl" advantageously refers to chains with 2-6 carbon atoms, preferably 4-5 carbon atoms. In this specification unless stated otherwise the term "alkynyl" includes both straight and branched chain alkynyl groups but references to  
10 individual alkynyl groups such as 2-butylnyl are specific for the straight chain version only. Unless otherwise stated the term "alkynyl" advantageously refers to chains with 2-6 carbon atoms, preferably 4-5 carbon atoms.

Within the present invention it is to be understood that a compound of the formula I or a salt thereof may exhibit the phenomenon of tautomerism and that the formulae drawings  
15 within this specification can represent only one of the possible tautomeric forms. It is to be understood that the invention encompasses any tautomeric form which inhibits VEGF receptor tyrosine kinase activity and is not to be limited merely to any one tautomeric form utilised within the formulae drawings.

It is also to be understood that certain compounds of the formula I and salts thereof  
20 can exist in solvated as well as unsolvated forms such as, for example, hydrated forms. It is to be understood that the invention encompasses all such solvated forms which inhibit VEGF receptor tyrosine kinase activity.

For the avoidance of any doubt, it is to be understood that when  $\text{X}^1$  is, for example, a group of formula  $-\text{NR}^7\text{CO}-$ , it is the nitrogen atom bearing the  $\text{R}^7$  group which is attached to  
25 the heterocyclic/quinoline ring and the carbonyl (CO) group is attached to  $\text{R}^6$ , whereas when  $\text{X}^1$  is, for example, a group of formula  $-\text{CONR}^8-$ , it is the carbonyl group which is attached to the heterocyclic/quinoline ring and the nitrogen atom bearing the  $\text{R}^8$  group is attached to  $\text{R}^6$ . A similar convention applies to the other two atom  $\text{X}^1$  linking groups such as  $-\text{NR}^{10}\text{SO}_2-$  and  $-\text{SO}_2\text{NR}^9-$ . When  $\text{X}^1$  is  $-\text{NR}^{11}-$  it is the nitrogen atom bearing the  $\text{R}^{11}$  group which is linked to  
30 the heterocyclic/quinoline ring and to  $\text{R}^6$ . When  $\text{X}^1$  is  $-\text{OCO}-$  it is the carbonyl group which is attached to the heterocyclic/quinoline ring and the oxy group is attached to  $\text{R}^6$ . Analogous conventions apply to groups  $\text{X}^{2-10}$ . It is further to be understood that when  $\text{X}^2$  represents -

NR<sup>13</sup>- and R<sup>13</sup> is C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl it is the C<sub>2-3</sub>alkyl moiety which is linked to the nitrogen atom of X<sup>2</sup> and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that when R<sup>30</sup> carries a C<sub>1-4</sub>aminoalkyl substituent it is the C<sub>1-4</sub>alkyl moiety which is attached to R<sup>30</sup> whereas when R<sup>30</sup> carries a C<sub>1-4</sub>alkylamino substituent it is the amino moiety which is attached to R<sup>30</sup> and an analogous convention applies to other groups.

The present invention relates to the use of the compounds of formula I as hereinbefore defined as well as to the salts thereof. Salts for use in pharmaceutical compositions will be pharmaceutically acceptable salts, but other salts may be useful in the production of the compounds of formula I and their pharmaceutically acceptable salts. Pharmaceutically acceptable salts of the invention may, for example, include acid addition salts of the compounds of formula I as hereinbefore defined which are sufficiently basic to form such salts. Such acid addition salts include for example salts with inorganic or organic acids affording pharmaceutically acceptable anions such as with hydrogen halides (especially hydrochloric or hydrobromic acid) or with sulphuric or phosphoric acid, or with trifluoroacetic, citric or maleic acid. In addition where the compounds of formula I are sufficiently acidic, pharmaceutically acceptable salts may be formed with an inorganic or organic base which affords a pharmaceutically acceptable cation. Such salts with inorganic or organic bases include for example an alkali metal salt, such as a sodium or potassium salt, an alkaline earth metal salt such as a calcium or magnesium salt, an ammonium salt or for example a salt with methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

A compound of the formula Id, or salt thereof, and other compounds of the invention (as hereinafter defined) may be prepared by any process known to be applicable to the preparation of chemically-related compounds. Such processes include, for example, those illustrated in European Patent Application, Publication No. 0326330 and United States Patent Application, Publication No. 3936461. Such processes, are provided as a further feature of the invention and are as described hereinafter. Necessary starting materials may be obtained by standard procedures of organic chemistry. The preparation of such starting materials is described within the accompanying non-limiting Examples. Alternatively necessary starting materials are obtainable by analogous procedures to those illustrated which are within the ordinary skill of an organic chemist.

Thus the following processes (a) to (f) and (i) to (vi) constitute further features of the present invention.

### Synthesis of Compounds of Formula I

- (a) Compounds of the formula I and salts thereof may be prepared by the reaction of  
5 a compound of the formula III:

(III)

- (wherein R¹, R³, Y¹, Y², Y³, Y⁴ and m are as defined hereinbefore and L¹ is a displaceable moiety), with a compound of the formula IV:

(IV)

- (wherein G¹, R² and n are as defined hereinbefore) whereby to obtain compounds of the formula  
25 I and salts thereof. A convenient displaceable moiety L¹ is, for example, a halogeno, alkoxy (preferably C<sub>1-4</sub>alkoxy), aryloxy or sulphonyloxy group, or an alkylthio group, for example a chloro, bromo, methoxy, phenoxy, methanesulphonyloxy or toluene-4-sulphonyloxy group, or a methylthio group.

- The reaction is advantageously effected in the presence of either an acid or a base.  
30 Such an acid is, for example, an anhydrous inorganic acid such as hydrogen chloride. Such a base is, for example, an organic amine base such as, for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, morpholine, N-methylmorpholine or

diazabicyclo[5.4.0]undec-7-ene, or for example, an alkali metal or alkaline earth metal carbonate or hydroxide, for example sodium carbonate, potassium carbonate, calcium carbonate, sodium hydroxide or potassium hydroxide. Alternatively such a base is, for example, an alkali metal hydride, for example sodium hydride, or an alkali metal or alkaline earth metal amide, for example sodium amide or sodium bis(trimethylsilyl)amide. The reaction is preferably effected in the presence of an inert solvent or diluent, for example an alkanol or ester such as methanol, ethanol, isopropanol or ethyl acetate, a halogenated solvent such as methylene chloride, trichloromethane or carbon tetrachloride, an ether such as tetrahydrofuran or 1,4-dioxan, an aromatic hydrocarbon solvent such as toluene, or a dipolar aprotic solvent such as N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidin-2-one or dimethylsulphoxide. The reaction is conveniently effected at a temperature in the range, for example, 10 to 150°C, preferably in the range 40 to 120°C.

The compound of the invention may be obtained from this process in the form of the free base or alternatively it may be obtained in the form of a salt with the acid of the formula  $H-L^1$  wherein  $L^1$  has the meaning defined hereinbefore. When it is desired to obtain the free base from the salt, the salt may be treated with a base as defined hereinbefore using a conventional procedure.

(b) Where the group of formula II:

(II)

(wherein  $R^a$ ,  $R^b$ ,  $R^c$  and  $R^d$  are as defined hereinbefore) represents a phenyl group carrying one or more hydroxy groups, a compound of the formula I and salts thereof can be prepared by the deprotection of a compound of formula V:

(wherein n, Y<sup>1</sup>, Y<sup>2</sup>, Y<sup>3</sup>, Y<sup>4</sup>, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, m and Z are as hereinbefore defined, P represents a phenolic hydroxy protecting group and p<sub>1</sub> is an integer from 1 to 5 equal to the number of protected hydroxy groups and such that n-p<sub>1</sub> is equal to the number of R<sup>2</sup> substituents which are not protected hydroxy). The choice of phenolic hydroxy protecting group P is within the standard knowledge of an organic chemist, for example those included in standard texts such as "Protective Groups in Organic Synthesis" T.W. Greene and R.G.M. Wuts, 2nd Ed. Wiley 1991, including ethers (for example, methyl, methoxymethyl, allyl and benzyl), silyl ethers (for example, t-butyldiphenylsilyl and t-butyldimethylsilyl), esters (for example, acetate and benzoate) and carbonates (for example, methyl and benzyl). The removal of such a phenolic hydroxy protecting group may be effected by any of the procedures known for such a transformation, including those reaction conditions indicated in standard texts such as that indicated hereinbefore, or by a related procedure. The reaction conditions preferably being such that the hydroxy derivative is produced without unwanted reactions at other sites within the starting or product compounds. For example, where the protecting group P is acetate, the transformation may conveniently be effected by treatment of the quinoline derivative with a base as defined hereinbefore and including ammonia, and its mono and di-alkylated derivatives, preferably in the presence of a protic solvent or co-solvent such as water or an alcohol, for example methanol or ethanol. Such a reaction can be effected in the presence of an additional inert solvent or diluent as defined hereinbefore and at a temperature in the range 0 to 50°C, conveniently at about 20°C.

(c) Production of those compounds of formula I and salts thereof wherein a substituent  $R^3$  is  $R^6-X^1$ - and wherein  $X^1$  is -O-, -S- or -NR<sup>11</sup>- can be achieved by the reaction, conveniently in the presence of a base as defined hereinbefore, of a compound of the formula VI:

(wherein  $n$ ,  $X^1$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $G^1$ ,  $R^1$ ,  $R^2$ ,  $R^3$ ,  $Z$  and  $m$  are as hereinbefore defined) with a compound of formula VII:

(wherein  $R^6$  and  $L^1$  are as hereinbefore defined);  $L^1$  is a displaceable moiety for example a halogeno or sulphonyloxy group such as a bromo or methanesulphonyloxy group. The reaction is preferably effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 150°C, conveniently at about 50°C.

(d) Compounds of the formula I and salts thereof wherein a substituent  $R^3$  is  $R^6-X^1$ - and wherein  $R^6$  is  $C_{1-3}alkylR^{61}$ , [wherein  $R^{61}$  is selected from one of the following two groups:  
 1)  $X^{11}R^{17}$  (wherein  $X^{11}$  represents -O-, -S-, -SO<sub>2</sub>-, -NR<sup>62</sup>CO-, -NR<sup>63</sup>SO<sub>2</sub>- or -NR<sup>64</sup>- (wherein  $R^{62}$ ,  $R^{63}$  and  $R^{64}$ , each independently represents hydrogen,  $C_{1-3}alkyl$  or  $C_{1-3}alkoxyC_{2-3}alkyl$ ) and  $R^{17}$  is as defined hereinbefore); and  
 2)  $X^{12}C_{1-3}alkylX^5R^{23}$  (wherein  $X^{12}$  represents -O-, -S-, -SO<sub>2</sub>-, -NR<sup>65</sup>CO-, -NR<sup>66</sup>SO<sub>2</sub>- or -NR<sup>67</sup>- (wherein  $R^{65}$ ,  $R^{66}$  and  $R^{67}$ , each independently represents hydrogen,  $C_{1-3}alkyl$  or  $C_{1-3}alkoxyC_{2-3}alkyl$ ) and  $X^5$  and  $R^{23}$  are as defined hereinbefore);]

may be prepared by reacting a compound of the formula VIII:

(VIII)

(wherein  $L^1$ ,  $X^1$ ,  $G^1$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $R^1$ ,  $R^2$ ,  $R^3$ ,  $Z$ ,  $m$  and  $n$  are as hereinbefore defined and  $R^{68}$  is  $C_{1-3}$ alkyl) with a compound of the formula IX:

(IX)

(wherein  $R^{61}$  is as defined hereinbefore) to give a compound of the formula I. The reaction may conveniently be effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), and at a temperature in the range, for example 0 to 150°C, conveniently at about 50°C.

Compounds of the formula I wherein a substituent  $R^3$  is  $R^6-X^1$ - and wherein  $R^6$  is  $C_{2-3}$ alkyl $R^{59}$ , (wherein  $R^{59}$  is as defined hereinbefore), may be prepared by reacting a compound of formula VIII (wherein  $R^{61}$  is  $C_{2-3}$ alkyl) with a compound of the formula IXa:

(IXa)

(wherein  $R^{59}$  is as defined hereinbefore) to give a compound of the formula I. The reaction may conveniently be effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), and at a temperature in the range, for example 0 to 150°C, conveniently at about 50°C.

(c) The production of those compounds of the formula I and salts thereof wherein a substituent  $R^3$  is represented by  $-NR^4R^5$ , where one or both of  $R^4$  and  $R^5$  are  $C_{1-3}$ alkyl, may be

effected by the reaction of compounds of formula I wherein the substituent  $R^3$  is an amino group and an alkylating agent, preferably in the presence of a base as defined hereinbefore. Such alkylating agents are  $C_{1-3}$ alkyl moieties bearing a displaceable moiety as defined hereinbefore such as  $C_{1-3}$ alkyl halides for example  $C_{1-3}$ alkyl chloride, bromide or iodide. The  
5 reaction is preferably effected in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)) and at a temperature in the range, for example, 10 to 100°C, conveniently at about ambient temperature.

(f) The production of compounds of formula I and salts thereof wherein one or more of the substituents  $R^2$  and  $R^3$  is an amino group may be effected by the reduction of a  
10 corresponding compound of formula I wherein the substituent(s) at the corresponding position(s) of the heterocyclic/quinoline and/or heterocyclic/phenyl ring is/are a nitro group(s). The reduction of the nitro group(s) may conveniently be effected by any of the procedures known for such a transformation. The reduction may be carried out, for example, by the hydrogenation of a solution of the nitro compound in the presence of an inert solvent or diluent  
15 as defined hereinbefore in the presence of a metal effective to catalyse hydrogenation reactions such as palladium or platinum. A further reducing agent is, for example, an activated metal such as activated iron (produced for example by washing iron powder with a dilute solution of an acid such as hydrochloric acid). Thus, for example, the reduction may be effected by heating the nitro compound and the activated metal in the presence of a solvent or diluent such  
20 as a mixture of water and alcohol, for example methanol or ethanol, to a temperature in the range, for example 50 to 150°C, conveniently at about 70°C. The production of a compound of formula I and salts thereof wherein the substituent(s) at the corresponding position(s) of the heterocyclic/quinoline and/or heterocyclic/phenyl ring is/are a nitro group(s) may be effected by the processes described hereinbefore and hereinafter in processes (a-d) and (i-vi) using a  
25 compound selected from the compounds of the formulae (I-XXIII) in which the substituent(s) at the corresponding position(s) of the heterocyclic/quinoline and/or heterocyclic/phenyl ring is/are a nitro group(s).

#### Synthesis of Intermediates

(i) Such compounds of formula III and salts thereof in which  $L^1$  is halogeno may for  
30 example be prepared by halogenating a compound of the formula X:

(X)

(wherein  $m$ ,  $R^1$ ,  $R^3$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$  and  $Y^4$  are as hereinbefore defined).

Convenient halogenating agents include inorganic acid halides, for example thionyl chloride, phosphorus(III)chloride, phosphorus(V)oxychloride and phosphorus(V)chloride. The halogenation reaction is conveniently effected in the presence of an inert solvent or diluent such as for example a halogenated solvent such as methylene chloride, trichloromethane or carbon tetrachloride, or an aromatic hydrocarbon solvent such as benzene or toluene. The reaction is conveniently effected at a temperature in the range, for example 10 to 150°C, preferably in the range 40 to 100°C.

The compounds of formula X and salts thereof wherein one or more of  $Y^1$ ,  $Y^2$ ,  $Y^3$  and  $Y^4$  are nitrogen, may for example, be prepared by any of the known procedures for making azaquinolones, such as procedures analogous to those described in "Comprehensive Heterocyclic Chemistry" Volume 2, Naphthyridine Chemistry, Katritzky and Rees, 1984; DE 2423650; Cubza, Synthesis 1974, 809; Barlin et al., Aust. J. Chem. 1984, 37 1065; WO 9313097 A1; WO 9500511 A1; Hirao et al., Bull. Chem. Soc. Jpn. 1973, 46, 1826; Carboni et al., Gazz. Chim. Ital. 1972, 102, 253 and 264; Carboni et al., Gazz Chim. Ital. 1971, 101, 129 and 133 and 137; Bowie J. Chem. Soc. Perk Trans I, 1972, 1106; Brown J. Org Chem. 1965, 30, 1607; Quequiner et al., Can. J. Chem. 1992, 70, 2828; Reynolds et al., J. Chem. Soc. Perk Trans II, 1988, 4, 551; Nagai et al JP 51054596; Sato et al JP 51054593.

The compounds of formula X and salts thereof may for example be prepared by reacting a compound of the formula XI:

(XI)

with a compound of the formula XII:

(XII)

(wherein R¹, R³, m, Y¹, Y², Y³, Y⁴, L¹, R⁶ and X¹ are as hereinbefore defined). The reaction may conveniently be effected the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 200°C, preferably in the range 100 to 150°C.

The compounds of formula X and salts thereof may also be prepared by cyclising a compound of the formula XIII:

(XIII)

(wherein Y¹, Y², Y³, Y⁴, R³ and m are as hereinbefore defined,) whereby to form a compound of formula X or salt thereof. The cyclisation may be effected by heating a compound of the

formula XIII in the presence of an inert solvent or diluent such as an ether, for example diphenyl ether, at an elevated temperature, preferably in the range 200 to 300°C.

Compounds of formula XIII may for example be prepared by reacting a compound of the formula XIV:

(XIV)

with a compound of the formula XV:

(XV)

(wherein Y<sup>1</sup>, Y<sup>2</sup>, Y<sup>3</sup>, Y<sup>4</sup>, R<sup>3</sup> and m are as hereinbefore defined and A<sup>1</sup> is an alkoxy (preferably C<sub>1-4</sub>alkoxy) group). The reaction may conveniently be effected in the presence of an alcohol as solvent, such as ethanol and advantageously at a temperature in the range for example 20 to 100°C, preferably in the range 50 to 100°C.

The compounds of formula III and salts thereof may also be prepared for example by reacting a compound of the formula XVI:

(XVI)

(wherein  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $R^1$ ,  $R^3$ ,  $m$  and  $X^1$  are as hereinbefore defined, with the proviso that  $X^1$  is not  $-CH_2-$ , and  $L^2$  represents a displaceable protecting moiety) with a compound of the formula VII as hereinbefore defined, whereby to obtain a compound of formula III in which  $L^1$  is represented by  $L^2$ .

A compound of formula XVI is conveniently used in which  $L^2$  represents a chloro group or a phenoxy group which may if desired carry up to 5 substituents, preferably up to 2 substituents, selected from halogeno, nitro and cyano. The reaction may be conveniently effected under conditions as described for process (c) hereinbefore.

The compounds of formula XVI and salts thereof as hereinbefore defined may for example be prepared by deprotecting a compound of the formula XVII:

(XVII)

(wherein  $R^1$ ,  $R^3$ ,  $m$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $P$ ,  $X^1$  and  $L^2$  are as hereinbefore defined). Deprotection may be effected by techniques well known in the literature, for example where  $P$  represents a benzyl group deprotection may be effected by hydrogenolysis or by treatment with trifluoroacetic acid.

One compound of formula III may if desired be converted into another compound of formula III in which the moiety  $L^1$  is different. Thus for example a compound of formula III in which  $L^1$  is other than halogeno, for example optionally substituted phenoxy, may be converted

to a compound of formula III in which  $L^1$  is halogeno by hydrolysis of a compound of formula III (in which  $L^1$  is other than halogeno) to yield a compound of formula X as hereinbefore defined, followed by introduction of halide to the compound of formula X, thus obtained as hereinbefore defined, to yield a compound of formula III in which  $L^1$  represents halogeno.

- 5 (ii) The compounds of formula V and salts thereof, constitute a further feature of the present invention, and may for example be prepared by the reaction of a compound of formula III as hereinbefore defined with a compound of the formula XVIII:

10

(XVIII)

- 15 (wherein  $R^2$ ,  $n$ ,  $Z$ ,  $p1$  and  $P$  are as hereinbefore defined). The reaction may for example be effected as described for process (a) hereinbefore.

The compounds of formula V and salts thereof may also be prepared by reacting a compound of formula XIX:

20

25

(XIX)

- 30 (wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $Z$ ,  $X^1$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $P$ ,  $p1$ ,  $m$  and  $n$  are as hereinbefore defined with the proviso that  $X^1$  is not  $-CH_2-$ ) with a compound of the formula VII as hereinbefore defined. The reaction may for example be effected as described for process (c) hereinbefore.

Compounds of the formula XIX and salts thereof constitute another feature of the present invention and may be made by reacting compounds of the formulae XVII and XVIII as hereinbefore defined, under conditions described in (a) hereinbefore, to give a compound of formula XX:

(XX)

(wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $Z$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $P$ ,  $X^1$ ,  $m$ ,  $p_l$  and  $n$  are as hereinbefore defined) and then deprotecting the compound of formula XX for example as described in (i) above. Compounds of the formula XX as hereinbefore defined and salts thereof constitute a further feature of the present invention.

(iii) Compounds of the formula VI as hereinbefore defined and salts thereof constitute a further feature of the present invention and may be made by deprotecting the compound of formula XXI:

(wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $Z$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $G^1$ ,  $P$ ,  $X^1$ ,  $m$  and  $n$  are as hereinbefore defined) by a process for example as described in (i) above.

Compounds of the formula XXI and salts thereof may be made by reacting compounds of the formulae XVII and IV as hereinbefore defined, under the conditions described in (a) hereinbefore, to give a compound of the formula XXI or salt thereof.

(iv) Compounds of the formula VIII as defined hereinbefore and salts thereof constitute a further feature of the present invention and may for example be made by the reaction of a compound of formula VI as defined hereinbefore with a compound of the formula XXII:

(XXII)

(wherein  $L^1$  and  $R^{68}$  are as hereinbefore defined) to give a compound of the formula VIII. The reaction may be effected for example by a process as described in (c) above.

Compounds of the formula VIII and salts thereof may also be made for example by deprotecting a compound of the formula XXIII:

(XXIII)

(wherein  $L^1$ ,  $R^{68}$ ,  $X^1$ ,  $R^1$ ,  $R^2$ ,  $R^3$ ,  $Z$ ,  $Y^1$ ,  $Y^2$ ,  $Y^3$ ,  $Y^4$ ,  $G^1$ ,  $P$ ,  $m$ ,  $n$  and  $p1$  are as defined hereinbefore) by a process for example as described in (b) above.

Compounds of the formula XXIII as hereinbefore defined and salts thereof constitute a further feature of the present invention and may be made for example by reacting compounds of the formulae XIX and XXII as defined hereinbefore, under the conditions described in (c) above.

(v) Compounds of the formula IV may be prepared by any known procedure for making substituted phenyl or substituted or unsubstituted heteroaromatic groups. France, 1958, 152,156; Pfannstiel et al., Chem. Bericht., 1942, 75, 1096; US 2787515, 1955; CH 543515, 1973; Boyer et al., J. Chem. Res. miniprint 1990, 11, 3601; Boyer et al., Heterocycles 1995, 41, 487.

(vi) Compounds of the formula I and salts thereof wherein  $R^1$  is fluoro, may be prepared by an analogous procedure to that described in Example 14.

When a pharmaceutically acceptable salt of a compound of the formula Id is required, it may be obtained, for example, by reaction of said compound with, for example, an acid using a conventional procedure, the acid having a pharmaceutically acceptable anion.

Many of the intermediates defined herein are novel, for example, those of the formulae V, VI, VIII, XIX, XX and XXIII and these are provided as a further feature of the invention.

Intermediates of the formulae III, X and XXI are also provided as a further feature of the invention.

The identification of compounds which potently inhibit the tyrosine kinase activity associated with the VEGF receptors such as Flt and/or KDR and which inhibit angiogenesis and/or increased vascular permeability is desirable and is the subject of the present invention. These properties may be assessed, for example, using one or more of the procedures set out below:

(a) In Vitro Receptor Tyrosine Kinase Inhibition Test

This assay determines the ability of a test compound to inhibit tyrosine kinase activity. DNA encoding VEGF or epidermal growth factor (EGF) receptor cytoplasmic domains may be obtained by total gene synthesis (Edwards M, International Biotechnology Lab 5(3), 19-25, 1987) or by cloning. These may then be expressed in a suitable expression system to obtain polypeptide with tyrosine kinase activity. For example VEGF and EGF receptor cytoplasmic domains, which were obtained by expression of recombinant protein in insect cells, were found to display intrinsic tyrosine kinase activity. In the case of the VEGF receptor Flt (Genbank accession number X51602), a 1.7kb DNA fragment encoding most of the cytoplasmic domain, commencing with methionine 783 and including the termination codon, described by Shibuya et al (Oncogene, 1990, 5: 519-524), was isolated from cDNA and cloned into a baculovirus transplacement vector (for example pAcYM1 (see The Baculovirus Expression System: A Laboratory Guide, L.A. King and R. D. Possee, Chapman and Hall, 1992) or pAc360 or pBlueBacHis (available from Invitrogen Corporation)). This recombinant construct was co-transfected into insect cells (for example *Spodoptera frugiperda* 21(Sf21)) with viral DNA (eg Pharmingen BaculoGold) to prepare recombinant baculovirus. (Details of the methods for the assembly of recombinant DNA molecules and the preparation and use of recombinant baculovirus can be found in standard texts for example Sambrook et al, 1989, Molecular cloning - A Laboratory Manual, 2nd edition. Cold Spring Harbour Laboratory Press and O'Reilly et al, 1992, Baculovirus Expression Vectors - A Laboratory Manual, W. H. Freeman and Co, New York). For other tyrosine kinases for use in assays, cytoplasmic fragments starting from methionine 806 (KDR, Genbank accession number L04947) and methionine 668 (EGF receptor, Genbank accession number X00588) may be cloned and expressed in a similar manner.

For expression of cFIt tyrosine kinase activity, Sf21 cells were infected with plaque-pure cFIt recombinant virus at a multiplicity of infection of 3 and harvested 48 hours later. Harvested cells were washed with ice cold phosphate buffered saline solution (PBS) (10mM sodium phosphate pH7.4, 138mM sodium chloride, 2.7mM potassium chloride) then resuspended in ice cold HNTG/PMSF (20mM Hepes pH7.5, 150mM sodium chloride, 10% v/v glycerol, 1% v/v Triton X100, 1.5mM magnesium chloride, 1mM ethylene glycol-bis( $\beta$ aminoethyl ether) N,N,N',N'-tetraacetic acid (EGTA), 1mM PMSF (phenylmethylsulphonyl fluoride); the PMSF is added just before use from a freshly-prepared 100mM solution in methanol) using 1ml HNTG/PMSF per 10 million cells. The suspension was centrifuged for 10 minutes at 13,000 rpm at 4°C, the supernatant (enzyme stock) was removed and stored in aliquots at -70°C. Each new batch of stock enzyme was titrated in the assay by dilution with enzyme diluent (100mM Hepes pH 7.4, 0.2mM sodium orthovanadate, 0.1% v/v Triton X100, 0.2mM dithiothreitol). For a typical batch, stock enzyme is diluted 1 in 2000 with enzyme diluent and 50 $\mu$ l of dilute enzyme is used for each assay well.

A stock of substrate solution was prepared from a random copolymer containing tyrosine, for example Poly (Glu, Ala, Tyr) 6:3:1 (Sigma P3899), stored as 1 mg/ml stock in PBS at -20°C and diluted 1 in 500 with PBS for plate coating.

On the day before the assay 100 $\mu$ l of diluted substrate solution was dispensed into all wells of assay plates (Nunc maxisorp 96-well immunoplates) which were sealed and left overnight at 4°C.

On the day of the assay the substrate solution was discarded and the assay plate wells were washed once with PBST (PBS containing 0.05% v/v Tween 20) and once with 50mM Hepes pH7.4.

Test compounds were diluted with 10% dimethylsulphoxide (DMSO) and 25 $\mu$ l of diluted compound was transferred to wells in the washed assay plates. "Total" control wells contained 10% DMSO instead of compound. Twenty five microlitres of 40mM manganese(II)chloride containing 8 $\mu$ M adenosine-5'-triphosphate (ATP) was added to all test wells except "blank" control wells which contained manganese(II)chloride without ATP. To start the reactions 50 $\mu$ l of freshly diluted enzyme was added to each well and the plates were incubated at room temperature for 20 minutes. The liquid was then discarded and the wells were washed twice with PBST. One hundred microlitres of mouse IgG anti-phosphotyrosine antibody (Upstate Biotechnology Inc. product 05-321), diluted 1 in 6000 with PBST containing

0.5% w/v bovine serum albumin (BSA), was added to each well and the plates were incubated for 1 hour at room temperature before discarding the liquid and washing the wells twice with PBST. One hundred microlitres of horse radish peroxidase (HRP)-linked sheep anti-mouse Ig antibody (Amersham product NXA 931), diluted 1 in 500 with PBST containing 0.5% w/v BSA, was added and the plates were incubated for 1 hour at room temperature before discarding the liquid and washing the wells twice with PBST. One hundred microlitres of 2,2'-azino-bis(3-ethylbenzthiazoline-6-sulphonic acid) (ABTS) solution, freshly prepared using one 50mg ABTS tablet (Boehringer 1204 521) in 50ml freshly prepared 50mM phosphate-citrate buffer pH5.0 + 0.03% sodium perborate (made with 1 phosphate citrate buffer with sodium perborate (PCSB) capsule (Sigma P4922) per 100ml distilled water), was added to each well. Plates were then incubated for 20-60 minutes at room temperature until the optical density value of the "total" control wells, measured at 405nm using a plate reading spectrophotometer, was approximately 1.0. "Blank" (no ATP) and "total" (no compound) control values were used to determine the dilution range of test compound which gave 50% inhibition of enzyme activity.

#### (b) In Vitro HUVEC Proliferation Assay

This assay determines the ability of a test compound to inhibit the growth factor-stimulated proliferation of human umbilical vein endothelial cells (HUVEC).

HUVEC cells were isolated in MCDB 131 (Gibco BRL) + 7.5% v/v foetal calf serum (FCS) and were plated out (at passage 2 to 8), in MCDB 131 + 2% v/v FCS + 3µg/ml heparin + 1µg/ml hydrocortisone, at a concentration of 1000 cells/well in 96 well plates. After a minimum of 4 hours they were dosed with the appropriate growth factor (i.e. VEGF 3ng/ml, EGF 3ng/ml or b-FGF 0.3ng/ml) and compound. The cultures were then incubated for 4 days at 37°C with 7.5% CO<sub>2</sub>. On day 4 the cultures were pulsed with 1µCi/well of tritiated-thymidine (Amersham product TRA 61) and incubated for 4 hours. The cells were harvested using a 96-well plate harvester (Tomtek) and then assayed for incorporation of tritium with a Beta plate counter. Incorporation of radioactivity into cells, expressed as cpm, was used to measure inhibition of growth factor-stimulated cell proliferation by compounds.

#### (c) In Vivo Rat Uterine Oedema Assay

This test measures the capacity of compounds to reduce the acute increase in uterine weight in rats which occurs in the first 4-6 hours following oestrogen stimulation. This early

increase in uterine weight has long been known to be due to oedema caused by increased permeability of the uterine vasculature and recently Cullinan-Bove and Koos (Endocrinology, 1993,133:829-837) demonstrated a close temporal relationship with increased expression of VEGF mRNA in the uterus. We have found that prior treatment of the rats with a neutralising monoclonal antibody to VEGF significantly reduces the acute increase in uterine weight, confirming that the increase in weight is substantially mediated by VEGF.

Groups of 20 to 22-day old rats were treated with a single subcutaneous dose of oestradiol benzoate (2.5µg/rat) in a solvent, or solvent only. The latter served as unstimulated controls. Test compounds were orally administered at various times prior to the administration of oestradiol benzoate. Five hours after the administration of oestradiol benzoate the rats were humanely sacrificed and their uteri were dissected, blotted and weighed. The increase in uterine weight in groups treated with test compound and oestradiol benzoate and with oestradiol benzoate alone was compared using a Student T test. Inhibition of the effect of oestradiol benzoate was considered significant when  $p < 0.05$ .

According to a further aspect of the invention there is provided a pharmaceutical composition which comprises a compound of the formula I as defined hereinbefore or a pharmaceutically acceptable salt thereof, in association with a pharmaceutically acceptable excipient or carrier which is in one of the following forms: (i) a tablet, lozenge or capsule suitable for oral administration; (ii) a parenteral injection (including intravenous, subcutaneous, intramuscular, intravascular or infusion) for example as a sterile solution, suspension or emulsion; (iii) an ointment, patch or cream for topical administration; or (iv) a suppository for rectal administration. In general the above compositions may be prepared in a conventional manner using conventional excipients.

The compositions of the present invention are advantageously presented in unit dosage form. The compound will normally be administered to a warm-blooded animal at a unit dose within the range 5-5000mg per square metre body area of the animal, i.e. approximately 0.1-100mg/kg. A unit dose in the range, for example, 1-100mg/kg, preferably 1-50mg/kg is envisaged and this normally provides a therapeutically-effective dose. A unit dose form such as a tablet or capsule will usually contain, for example 1-250mg of active ingredient.

According to a further aspect of the present invention there is provided a compound of the formula I or a pharmaceutically acceptable salt thereof as defined hereinbefore for use in a method of treatment of the human or animal body by therapy.

We have found that compounds of the present invention inhibit VEGF receptor tyrosine kinase activity and are therefore of interest for their antiangiogenic effects and/or their ability to cause a reduction in vascular permeability.

Thus according to a further aspect of the invention there is provided the use of a  
5 compound of the formula I, or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for use in the production of an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal such as a human being.

According to a further feature of the invention there is provided a method for  
10 producing an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal, such as a human being, in need of such treatment which comprises administering to said animal an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof as defined hereinbefore.

As stated above the size of the dose required for the therapeutic or prophylactic treatment of a particular disease state will necessarily be varied depending on the host treated,  
15 the route of administration and the severity of the illness being treated. Preferably a daily dose in the range of 1-50mg/kg is employed. However the daily dose will necessarily be varied depending upon the host treated, the particular route of administration, and the severity of the illness being treated. Accordingly the optimum dosage may be determined by the practitioner who is treating any particular patient.

20 The antiangiogenic and/or vascular permeability reducing treatment defined hereinbefore may be applied as a sole therapy or may involve, in addition to a compound of the invention, one or more other substances and/or treatments. Such conjoint treatment may be achieved by way of the simultaneous, sequential or separate administration of the individual components of the treatment. In the field of medical oncology it is normal practice to use a  
25 combination of different forms of treatment to treat each patient with cancer. In medical oncology the other component(s) of such conjoint treatment in addition to the antiangiogenic and/or vascular permeability reducing treatment defined hereinbefore may be: surgery, radiotherapy or chemotherapy. Such chemotherapy may cover three main categories of therapeutic agent:

30 (i) other antiangiogenic agents that work by different mechanisms from those defined hereinbefore (for example linomide, inhibitors of integrin  $\alpha v \beta 3$  function, angiostatin, razoxin, thalidomide);

(ii) cytostatic agents such as antioestrogens (for example tamoxifen, toremifene, raloxifene, droloxifene, idoxifene), progestogens (for example megestrol acetate), aromatase inhibitors (for example anastrozole, letrozole, vorazole, exemestane), antiprogestogens, antiandrogens (for example flutamide, nilutamide, bicalutamide, cyproterone acetate), LHRH agonists and antagonists (for example goserelin acetate, luprolide), inhibitors of testosterone 5 $\alpha$ -dihydroreductase (for example finasteride), anti-invasion agents (for example metalloproteinase inhibitors like marimastat and inhibitors of urokinase plasminogen activator receptor function) and inhibitors of growth factor function, (such growth factors include for example EGF, FGFs, platelet derived growth factor and hepatocyte growth factor such inhibitors include growth factor antibodies, growth factor receptor antibodies, tyrosine kinase inhibitors and serine/threonine kinase inhibitors); and

(iii) antiproliferative/antineoplastic drugs and combinations thereof, as used in medical oncology, such as antimetabolites (for example antifolates like methotrexate, fluoropyrimidines like 5-fluorouracil, purine and adenosine analogues, cytosine arabinoside); antitumour antibiotics (for example anthracyclines like doxorubicin, daunomycin, epirubicin and idarubicin, mitomycin-C, dactinomycin, mithramycin); platinum derivatives (for example cisplatin, carboplatin); alkylating agents (for example nitrogen mustard, melphalan, chlorambucil, busulphan, cyclophosphamide, ifosfamide, nitrosoureas, thiotepa); antimitotic agents (for example vinca alkaloids like vincristine and taxoids like taxol, taxotere); topoisomerase inhibitors (for example epipodophyllotoxins like etoposide and teniposide, amsacrine, topotecan).

As stated above the compounds defined in the present invention are of interest for their antiangiogenic and/or vascular permeability reducing effects. Such compounds of the invention are expected to be useful in a wide range of disease states including cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, arterial restenosis, autoimmune diseases, acute inflammation and ocular diseases with retinal vessel proliferation. In particular such compounds of the invention are expected to inhibit the growth of those primary and recurrent solid tumours which are associated with VEGF, especially those tumours which are significantly dependent on VEGF for their growth and spread, including for example, certain tumours of the colon, breast, prostate, lung, vulva and skin.

In addition to their use in therapeutic medicine, the compounds of formula I and their pharmaceutically acceptable salts are also useful as pharmacological tools in the development and standardisation of in vitro and in vivo test systems for the evaluation of the effects of inhibitors of VEGF receptor tyrosine kinase activity in laboratory animals such as cats, dogs, rabbits, monkeys, rats and mice, as part of the search for new therapeutic agents.

It is to be understood that where the term "ether" is used anywhere in this specification it refers to diethyl ether.

The invention will now be illustrated in the following non-limiting Examples in which, unless otherwise stated:-

(iv) yields are given for illustration only and are not necessarily the maximum attainable;

(v) melting points are uncorrected and were determined using a Mettler SP62 automatic melting point apparatus, an oil-bath apparatus or a Koffler hot plate apparatus.

Chem. 1967, 98, 564), was added. The product immediately crystallised out. The mixture was heated briefly to 80°C then cooled to ambient temperature. The solid product was collected by filtration and washed with isopropanol, followed by ether/isopropanol (1/1) and ether to give 5-((4-acetoxy-3-methoxyanilino)methylene)-2,2-dimethyl-1,3-dioxane-4,6-dione (11.83g, 82%).

A suspension of 5-((4-acetoxy-3-methoxyanilino)methylene)-2,2-dimethyl-1,3-dioxane-4,6-dione (11.5g) in DOWTHERM A, (trade mark of Fluka Chemie AG), (125ml) was heated at 195°C for 30 minutes. After cooling, ether was added (100ml) and the precipitate was collected by filtration. The solid was washed with ether and dried under vacuum to give 6-acetoxy-7-methoxy-1,4-dihydroquinolin-4-one which was used without further purification for the next step.

A solution of 6-acetoxy-7-methoxy-1,4-dihydroquinolin-4-one (6.2g, 28mmol) and thionyl chloride (75ml) containing DMF (0.5ml) was heated at reflux for 1 hour. The volatiles were removed by evaporation. The residue was suspended in methylene chloride (5ml) and poured slowly into a stirred solution of methanol/ammonium hydroxide. The mixture was partitioned between water and methylene chloride and dried by passing through phase separating paper. Removal of the solvent by evaporation gave a solid which was triturated with ether, collected by filtration, washed with ether and dried under vacuum to give 4-chloro-6-hydroxy-7-methoxyquinoline.

A solution of 4-(4-chloro-2-fluoroanilino)-6-hydroxy-7-methoxyquinoline (210mg, 0.66mmol), (prepared as described for the starting material in Example 60), 4-(3-chloropropyl)morpholine (132mg, 0.66mmol), (J. Amer. Chem. Soc. 1945, 67, 736), potassium carbonate (182mg, 1.2mmol) and DMF (7.5ml) was heated at 80°C for 4 hours. The mixture was cooled to ambient temperature and partitioned between water and methylene chloride.
